## Overview

A capacitor is made up of two metallic plates with a dielectric material (a material that does not conduct electricity) in between the plates. And there's actually no more magic to it. It's that simple and you can even make. I like to answer the question of "How does a capacitor work?"

" by saying that a capacitor works like a tiny rechargeable battery with very low capacity. But a capacitor is usually charged and discharged. If you want to get a really good understanding of capacitors and how to use them in your circuits, there are two important things you need to know: 1. What happens to the voltage. There are many different capacitor types. But when you start out, the main thing to remember is the difference between a polarized and a non-polarized capacitor. A polarized capacitor. Capacitors are used for a lot of things, such as: 1. Adding a time delay in a circuit 2. Making oscillators (for example to make a light blink) 3. Creating audio filters (such as low-pass and high-pass).

Hi, thanks for sharing your circuit diagram. Regarding circuit with two MOV & 10 Ohm R, i need to use it for my device, 230~235V input, protected from AC line at max 240V. It consume just 0.1 A (100mA~150mA) current. Based on the formula you gave, is it not too big for R? Supply- input V/I load =  $240_{\text{max}} - 230 \sim 235 / 100 \sim 150\text{mA} (0.1\text{A}) = \sim 2\text{K } R$  ?
