

Risks of battery energy storage

Overview

When insurers are reviewing a BESS project, their primary concern is thermal runaway. Thermal runaway is an uncontrolled exothermic reaction that raises cell temperature and can propagate between cells, occurring when a cell achieves elevated temperatures. Thermal runaway can occur due to mechanical. Probable Maximum Loss (PML) is an insurer's risk analysis of a project's 'worst case' loss scenario. For BESS projects, the PML is likely to be a. Insurers will always ask for proof that the manufacturers batteries have undergone successful UL9540a testing - the UL9540a is a test method for evaluating thermal runaway fire propagation in BESS. The batteries are tested on how capable their fire suppression. Insurers will review the Battery Management System's ability to identify, control, and eliminate potential risk scenarios. Battery Management Systems should have: 1. Recording. Gases being given off by battery cells are an early indicator that a thermal runaway event is occurring, so early detection of gases is critical before a build-up can become volatile. In.
